

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1. (currently amended) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first operating unit and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second operating unit and having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

2. (original) The operating device as claimed in claim 1, further comprising a vibration-imparting unit arranged in at least one of said first and second grips.

3. (original) The operating device as claimed in claim 1, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and

sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

4. (currently amended) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body so as to be positioned between said first and second grips, ~~each of said third and fourth operating units~~ having an input element operable to generate a signal, and said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

5. (original) The operating device as claimed in claim 4, further comprising a vibration-imparting unit arranged in at least one of said first and second grips.

6. (original) The operating device as claimed in claim 4, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main

body, each of said fifth and sixth operating units having an input element operable to generate a signal.

7. (currently amended) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said one of said spaced positions and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said another one of said spaced positions and having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

8. (original) The operating device as claimed in claim 7, further comprising a vibration-imparting unit arranged in at least one of said first and second grips.

9. (original) The operating device as claimed in claim 7, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main

body, each of said fifth and sixth operating units having an input element operable to generate a signal.

10. (currently amended) An operating device for a game machine, comprising:

a main body having front and rear sides;  
first and second grips protruding at spaced positions from said rear side of said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, ~~each of said third and fourth operating units having an input element operable to generate a signal, and said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member,~~ said third and fourth operating units projecting from said main body between said first and second grips.

11. (currently amended) The operating device as claimed in claim 10, further comprising a vibration-imparting unit arranged in at ~~least~~least one of said first and second grips.

12. (original) The operating device as claimed in claim 10, further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable

to generate a signal.

13. (currently amended) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

a third operating unit projecting from said first operating unit to a position between said first and second grips, said third operating unit having an input element operable to generate a signal; and

a fourth operating unit projecting from said second operating unit to a position between said first and second grips, said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

14. (original) The operating device as claimed in claim 13, further comprising a vibration-imparting unit arranged in at least one of said first and second grips.

15. (original) The operating device as claimed in claim 13, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main

body, each of said fifth and sixth operating units having an input element operable to generate a signal.

16. (currently amended) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first grip and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second grip and having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

17. (original) The operating device as claimed in claim 16, further comprising a vibration-imparting unit arranged in at least one of said first and second grips.

18. (original) The operating device as claimed in claim 16, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an

input element operable to generate a signal.

19. (currently amended) A game machine, comprising:  
a main unit for reading a game program; and  
an operating device interconnected with said main unit, said operating device including:  
a main body;  
first and second grips protruding at spaced positions from said main body;  
a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;  
a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and  
third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first operating unit and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second operating unit and having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

20. (currently amended) A game machine, comprising:  
a main unit for reading a game program; and  
an operating device interconnected with said main unit, said operating device including:  
a main body;  
first and second grips protruding at spaced positions from said main body;  
a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit

having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body so as to be positioned between said first and second grips, ~~each of said third and fourth operating units~~ having an input element operable to generate a signal, and said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

21. (currently amended) A game machine, comprising:

a main unit for reading a game program;

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

the first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said one of said spaced positions and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said another one of said spaced positions and having a rotation member and an input element

operable to generate a signal in response to an operation of said rotation member.

22. (currently amended) A game machine, comprising:  
a main unit for reading a game program; and  
an operating device interconnected with said main unit, said operating device including:  
a main body having front and rear sides;  
first and second grips protruding at spaced positions from said rear side of said main body;  
a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;  
a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and  
third and fourth operating units mounted to said main body, ~~each of said third and fourth operating units~~ having an input element operable to generate a signal, and said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member, said third and fourth operating units projecting from said main body between said first and second grips.

23. (currently amended) A game machine, comprising:  
a main unit for reading a game program; and  
an operating device interconnected with said main unit, said operating device including:  
a main body;  
first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

a third operating unit projecting from said first operating unit to a position between said first and second grips, said third operating unit having an input element operable to generate a signal; and

a fourth operating unit projecting from said second operating unit to a position between said first and second grips, said fourth operating unit having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

24. (currently amended) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent

said first grip and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second grip and having a rotation member and an input element operable to generate a signal in response to an operation of said rotation member.

25. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first operating unit and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second operating unit and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

26. (NEW) The operating device as claimed in claim 25, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body,

each of said fifth and sixth operating units having an input element operable to generate a signal.

27. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body so as to be positioned between said first and second grips, each of said third and fourth operating units having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

28. (NEW) The operating device as claimed in claim 27, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

29. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said one of said spaced positions and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said another one of said spaced positions and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

30. (NEW) The operating device as claimed in claim 29, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

31. (NEW) An operating device for a game machine, comprising:

a main body having front and rear sides;

first and second grips protruding at spaced positions from said rear side of said main body;

a first operating unit mounted to said main body

adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, each of said third and fourth operating units having an input element operable to generate a signal, said third and fourth operating units projecting from said main body between said first and second grips; and

a vibration-imparting unit arranged in each of said first and second grips.

32. (NEW) The operating device as claimed in claim 31, further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

33. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

a third operating unit projecting from said first

operating unit to a position between said first and second grips, said third operating unit having an input element operable to generate a signal;

a fourth operating unit projecting from said second operating unit to a position between said first and second grips, said fourth operating unit having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

34. (NEW) The operating device as claimed in claim 33, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

35. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first grip and having an input element operable to generate

a signal, and said fourth operating unit being positioned adjacent said second grip and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

36. (NEW) The operating device as claimed in claim 35, wherein said main body has front and rear sides, said first and second grips protruding from said rear side of said main body, said operating device further comprising fifth and sixth operating units arranged on said front side of said main body, each of said fifth and sixth operating units having an input element operable to generate a signal.

37. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first operating unit and having an input element operable to generate a signal, and said fourth operating unit being

positioned adjacent said second operating unit and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

38. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body so as to be positioned between said first and second grips, each of said third and fourth operating units having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

39. (NEW) A game machine, comprising:

a main unit for reading a game program;

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

the first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said one of said spaced positions and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said another one of said spaced positions and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

40. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body having front and rear sides;

first and second grips protruding at spaced positions from said rear side of said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, each of said third and fourth operating units having

an input element operable to generate a signal, said third and fourth operating units projecting from said main body between said first and second grips; and

a vibration-imparting unit arranged in each of said first and second grips.

41. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

a third operating unit projecting from said first operating unit to a position between said first and second grips, said third operating unit having an input element operable to generate a signal;

a fourth operating unit projecting from said second operating unit to a position between said first and second grips, said fourth operating unit having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

42. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips protruding at spaced positions from said main body;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal;

third and fourth operating units mounted to said main body, said third operating unit being positioned adjacent said first grip and having an input element operable to generate a signal, and said fourth operating unit being positioned adjacent said second grip and having an input element operable to generate a signal; and

a vibration-imparting unit arranged in each of said first and second grips.

43. (NEW) An operating device for a game machine, comprising:

a main body;

first and second grips projecting in a first direction from said main body at spaced positions;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units projecting in said first direction from said main body between said first and second grips, each of said third and fourth operating units having an input element operable to generate a signal.

44. (NEW) A game machine, comprising:  
a main unit for reading a game program; and  
an operating device interconnected with said main unit, said operating device including:  
a main body;  
first and second grips projecting in a first direction from said main body at spaced positions;  
a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;  
a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and  
third and fourth operating units projecting in said first direction from said main body between said first and second grips, each of said third and fourth operating units having an input element operable to generate a signal.

45. (NEW) An operating device for a game machine, comprising:  
a main body;  
first and second grips projecting at spaced positions from said main body, said first and second grips and said main body collectively defining a generally U-shape in a plane when viewed in a direction normal to said plane;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body so as to be positioned within said U-shape when viewed from said direction normal to said plane, each of said third and fourth operating units having an input element operable to generate a signal.

46. (NEW) A game machine, comprising:

a main unit for reading a game program; and

an operating device interconnected with said main unit, said operating device including:

a main body;

first and second grips projecting at spaced positions from said main body, said first and second grips and said main body collectively defining a generally U-shape in a plane when viewed in a direction normal to said plane;

a first operating unit mounted to said main body adjacent one of said spaced positions, said first operating unit having an input element operable to generate a signal;

a second operating unit mounted to said main body adjacent another one of said spaced positions, said second operating unit having an input element operable to generate a signal; and

third and fourth operating units mounted to said main body so as to be positioned within said U-shape when viewed from said direction normal to said plane, each of said third and

fourth operating units having an input element operable to generate a signal.
